Response to 8/16/05 Office Action

Atty. Dkt. BA4-198 (12839-E CIP)

Amendments to the Claims:

Claims 1-12 (cancelled).

Claim 13 (currently amended): A method of remotely monitoring the status

of multiple fire extinguishers, the method comprising:

coupling sensors to respective fire extinguishers in sensing relation to the

fire extinguishers, the sensors each being configured to sense a parameter of

the fire extinguisher to which it is coupled;

associating transmitters with respective fire extinguishers, the transmitters

being configured to selectively transmit information identifying the fire

extinguisher with which the transmitter is associated and to selectively transmit

information indicative of the sensed parameter;

providing a receiver in selective wireless communications with the

transmitters; and

providing a computer coupled to the receiver, the computer being

configured to maintain testing schedules for respective fire extinguishers and

being configured to provide an output when it is time for an extinguisher to be

inspected, tested, or undergo maintenance, the computer also being configured

to selectively store information from a plurality of the transmitters; and

s:\BA4\198\M03.doc

Response to 8/16/05 Office Action

Atty. Dkt. BA4-198 (12839-E CIP)

using a radio frequency identification device to define one of the

transmitters and to also define a sensor to sense if the associated fire

extinguisher is moved, the radio frequency identification device including a

conductor configured to be broken in response to movement of the associated

fire extinguisher.

Claim 14 (original): A method of remotely monitoring the status of multiple

fire extinguishers in accordance with claim 13 wherein at least one of the

transmitters is configured to communicate with the receiver via another of the

transmitters.

Claim 15 (original): A method of remotely monitoring the status of multiple

fire extinguishers in accordance with claim 13 wherein at least one of the

sensors is configured to sense if the associated fire extinguisher is moved.

Claim 16 (original): A method of remotely monitoring the status of multiple

fire extinguishers in accordance with claim 13 wherein at least one of the

sensors is configured to sense movement of a fire extinguisher trigger pin

relative to a fire extinguisher trigger.

Response to 8/16/05 Office Action

Atty. Dkt. BA4-198 (12839-E CIP)

Claim 17 (original): A method of remotely monitoring the status of multiple

fire extinguishers in accordance with claim 13 wherein at least one of the

sensors is configured to sense fire extinguisher pressure.

Claim 18 (original): A method of remotely monitoring the status of multiple

fire extinguishers in accordance with claim 13 and further comprising defining at

least some of the transmitters using radio frequency identification devices that

respectively include a transmitter, a processor coupled to the transmitter, and a

battery coupled to supply power to the transmitter and processor, and that are

configured to selectively identify themselves to the receiver.

Claim 19 (original): A method of remotely monitoring the status of multiple

fire extinguishers in accordance with claim 13 and further comprising using a

radio frequency identification device to define one of the transmitters and also

define a sensor.

Claim 20 (cancelled).

Claim 21 (original): A method of remotely monitoring the status of multiple

fire extinguishers in accordance with claim 13 wherein at least some of the

transmitters are defined by transceivers.

s:\BA4\198\M03.doc

Response to 8/16/05 Office Action

Atty. Dkt. BA4-198 (12839-E CIP)

Claim 22 (original): A system for remotely monitoring the status of a fire

extinguisher, the fire extinguisher having a trigger and a trigger pin arranged

such that the trigger pin must be removed before the trigger can be operated,

the system comprising:

a tamper-indicating device including a tamper-responsive section and a

tamper-signaling section, the tamper-responsive section defining a damage-

sensitive portion between first and second coupling portions, the damage

sensitive portion being in either an intact and a non-intact condition, the first

coupling portion being adapted to be coupled to the trigger pin and the second

coupling portion being adapted to be coupled external of the trigger pin of the

fire extinguisher, the tamper-signaling section being configured to selectively

transmit information indicating whether the damage sensitive portion is in the

intact or non-intact condition.

Claim 23 (original): A system for remotely monitoring the status of a fire

extinguisher in accordance with claim 22 wherein the tamper-signaling section is

further configured to identify the fire extinguisher.

s:\BA4\198\M03.doc

Response to 8/16/05 Office Action

Atty. Dkt. BA4-198 (12839-E CIP)

Claim 24 (original): A system for remotely monitoring the status of a fire

extinguisher in accordance with claim 22 and further including means for

sensing if the fire extinguisher is moved.

Claim 25 (original): A system for remotely monitoring the status of a fire

extinguisher in accordance with claim 22 and further comprising a second

tamper-indicating device including a tamper-responsive section, the tamper-

responsive section of the second tamper-indicating device defining a second

damage sensitive portion between third and fourth coupling portions, the second

damage sensitive portion being in either an intact and a non-intact condition, the

third coupling portion being adapted to be coupled to the fire extinguisher and

the second coupling portion being adapted to be coupled external of the fire

extinguisher.

Claim 26 (original): A system for remotely monitoring the status of a fire

extinguisher in accordance with claim 25 wherein the second tamper-indicating

device includes a tamper-signaling section coupled to the tamper-responsive

section of the second tamper-indicating device, the tamper-signaling section of

the second tamper-indicating device being configured to selectively transmit

information indicating whether the second damage sensitive portion is in the

intact or non-intact condition.

s:\BA4\198\M03.doc

Claim 27 (original): A system for remotely monitoring the status of a fire

extinguisher in accordance with claim 22 and further including means for

sensing fire extinguisher pressure.

Claim 28 (original): A system for remotely monitoring the status of a fire

extinguisher in accordance with claim 22 wherein the tamper-signaling section is

defined by a radio frequency identification device that includes a transmitter, a

processor coupled to the transmitter, and a battery coupled to supply power to

the transmitter and processor, and that is configured to selectively identify itself.

Claim 29 (original): A system for remotely monitoring the status of a fire

extinguisher in accordance with claim 22 wherein the tamper-signaling section is

defined by a transceiver.

Claim 30 (currently amended): A system for remotely monitoring if a fire

extinguisher is moved, the system comprising:

a an RF tamper-indicating device including a tamper-responsive section

and a transmitting tamper-signaling section, the tamper-responsive section

defining a damage-sensitive portion between first and second coupling portions,

the damage sensitive portion being in either an intact and a non-intact condition,

s:\BA4\198\M03.doc

Response to 8/16/05 Office Action

Atty. Dkt. BA4-198 (12839-E CIP)

the first coupling portion being adapted to be coupled to the fire extinguisher and

the second coupling portion being adapted to be fixed to a surface external of

the fire extinguisher, the tamper-signaling section being configured to selectively

transmit information indicating whether the damage sensitive portion is in the

intact or non-intact condition.

Claim 31 (original): A system for remotely monitoring if a fire extinguisher

is moved in accordance with claim 30 wherein the tamper-signaling section is

further configured to identify the fire extinguisher with which the first coupling

portion of the tamper-indicating device is coupled.

Claim 32 (original): A system for remotely monitoring if a fire extinguisher

is moved in accordance with claim 30 and further multiple tamper-indicating

devices coupled to respective fire extinguishers, and a common interrogator

configured to selectively communicate with the tamper-signaling section of any

of the tamper-indicating devices.

Claim 33 (original): A system for remotely monitoring if a fire extinguisher

is moved in accordance with claim 30 and further comprising a second

tamper-indicating device including a tamper-responsive section, the tamper-

responsive section of the second tamper-indicating device defining a second

s:\BA4\198\M03.doc

Atty. Dkt. BA4-198 (12839-E CIP)

damage sensitive portion between third and fourth coupling portions, the second

damage sensitive portion being in either an intact and a non-intact condition, the

third coupling portion being adapted to be coupled to a trigger pin of the fire

extinguisher and the second coupling portion being adapted to be coupled to a

fixed surface external of the trigger pin of the fire extinguisher, the second

tamper-indicating device including a tamper-signaling section coupled to the

tamper-responsive section of the second tamper-indicating device, the tamper-

signaling section of the second tamper-indicating device being configured to

selectively transmit information indicating whether the second damage sensitive

portion is in the intact or non-intact condition.

Claim 34 (original): A system for remotely monitoring if a fire extinguisher

is moved in accordance with claim 33 and further comprising a common

interrogator configured to selectively communicate with the tamper-signaling

section of either of the tamper-indicating devices.

Claim 35 (original): A system for remotely monitoring if a fire extinguisher

is moved in accordance with claim 30 and further including means for sensing

fire extinguisher pressure.

s:\BA4\198\M03.doc

Claim 36 (original): A system for remotely monitoring if a fire extinguisher

is moved in accordance with claim 30 wherein the tamper-signaling section is

defined by a radio frequency identification device that includes a transmitter, a

processor coupled to the transmitter, and a battery coupled to supply power to

the transmitter and processor, and that is configured to selectively identify itself.

Claim 37 (original): A system for remotely monitoring if a fire extinguisher

is moved in accordance with claim 30 wherein the tamper-signaling section is

defined by a transceiver.

Claim 38 (currently amended): A method of remotely monitoring the status

of multiple fire extinguishers, the method comprising:

associating transceivers with respective fire extinguishers, with at least

some of the transceivers configured to cause an alarm signal in response to a

fire extinguisher being moved, and with at least some of the transceivers

configured to cause an alarm signal in response to extinguisher pressure below

a predetermined threshold, the transceivers being configured to store and

selectively transmit information identifying the fire extinguisher with which the

transceiver is associated;

providing an interrogator in selective wireless communication with the

transceivers; and

s:\BA4\198\M03.doc

providing a computer coupled to the interrogator, the computer being

configured to maintain inspection, testing, maintenance schedules for respective

fire extinguishers and being configured to provide an output when it is time for

an extinguisher to be inspected, tested, or undergo maintenance, the computer

also being configured to provide an output in response to an alarm signal being

generated and

using radio frequency identification devices to define at least some of the

transceivers and to also define sensors to sense if the associated fire

extinguisher is moved, respective radio frequency identification devices

including a frangible wire configured to be broken in response to movement of

the associated fire extinguisher.

Claim 39 (original): A method of remotely monitoring the status of multiple

fire extinguishers in accordance with claim 38 wherein at least one of the

transponders is configured to communicate with the computer via another of the

transponders.

Claim 40 (original): A method of remotely monitoring the status of multiple

fire extinguishers in accordance with claim 38 wherein associating transceivers

comprises configuring at least one of the transceivers to send an alarm signal in

response to the associated fire extinguisher being moved.

s:\BA4\198\M03.doc

Claim 41 (original): A method of remotely monitoring the status of multiple

fire extinguishers in accordance with claim 38 and further comprising defining

the transceivers using radio frequency identification devices that respectively

include a transceiver, a processor coupled to the transceiver, and a battery

coupled to supply power to the transceiver and processor, and that are

configured to identify themselves to the computer.

Claim 42 (cancelled).

Claim 43 (original): A method of remotely monitoring the status of multiple

fire extinguishers in accordance with claim 38 wherein a plurality of

transponders are configured to communicate with the computer via another of

the transponders.

Claim 44 (currently amended): A system for remotely monitoring the status

of multiple fire extinguishers, the system comprising:

transceivers configured to be associated with respective fire extinguishers,

with at least some of the transceivers including a frangible wire configured to

break and cause an alarm signal in response to a fire extinguisher being moved,

and with at least some of the transceivers configured to cause an alarm signal in

s:\BA4\198\M03.doc

Response to 8/16/05 Office Action

Atty. Dkt. BA4-198 (12839-E CIP)

response to extinguisher pressure below a predetermined threshold, the

transceivers being configured to store and selectively transmit information

identifying the fire extinguisher with which the transceiver is associated;

an interrogator in selective wireless communication with the transceivers;

and

a computer coupled to the interrogator, the computer being configured to

maintain inspection, testing, or maintenance schedules for respective fire

extinguishers and being configured to provide an output when it is time for an

extinguisher to be inspected, tested, or undergo maintenance, the computer also

being configured to provide an output in response to an alarm signal being

generated.

Claim 45 (original): A system for remotely monitoring the status of multiple

fire extinguishers in accordance with claim 44 wherein at least one of the

transponders is configured to communicate with the computer via another of the

transponders.

Claim 46 (original): A system for remotely monitoring the status of multiple

fire extinguishers in accordance with claim 44 wherein at least one of the

transceivers is configured to send an alarm signal in response to the associated

fire extinguisher being moved.

s:\BA4\198\M03.doc

Claim 47 (original): A system for remotely monitoring the status of multiple

fire extinguishers in accordance with claim 44 and further comprising defining

the transceivers using radio frequency identification devices that respectively

include a transceiver, a processor coupled to the transceiver, and a battery

coupled to supply power to the transceiver and processor, and that are

configured to identify themselves to the computer.

Claim 48 (currently amended): A system for remotely monitoring the status

of multiple fire extinguishers in accordance with claim 44 wherein at least one of

the transceivers is defined by a radio frequency identification device, and

wherein the radio frequency identification device is also configured to cause an

alarm signal in response to the associated fire extinguisher being moved, the

radio frequency identification device including a conductor configured to be

broken in response to movement of the associated fire extinguisher such that the

radio frequency identification device is no longer able to communicate with the

computer, and wherein such inability to communicate causes the computer to

generate an alarm signal.

Claim 49 (original): A system for remotely monitoring the status of multiple

fire extinguishers in accordance with claim 44 wherein at least one of the

s:\BA4\198\M03.doc

Response to 8/16/05 Office Action

Atty. Dkt. BA4-198 (12839-E CIP)

transponders is configured to communicate with the computer via another of the

transponders.

Claim 50 (original): A system for remotely monitoring the status of multiple

fire extinguishers, the system comprising:

sensors configured to sense removal, or tampering, of trigger pins of

respective fire extinguishers;

wireless transmitters coupled to respective sensors and configured to

selectively transmit whether the trigger pin of the respective fire extinguisher has

been removed or tampered with; and

a receiver configured to selectively receive the transmissions for the

multiple fire extinguishers at a common location.

Claim 51 (original): A system for remotely monitoring the status of multiple

fire extinguishers in accordance with claim 50 and further comprising a computer

coupled to the receiver and configured to maintain inspection, testing, and

maintenance schedules for the respective fire extinguishers and to provide a

signal when it is time for one of the fire extinguishers to be tested.

Claim 52 (original): A system for remotely monitoring the status of multiple

fire extinguishers in accordance with claim 50 and further comprising a sensor,

s:\BA4\198\M03.doc

Response to 8/16/05 Office Action

Atty. Dkt. BA4-198 (12839-E CIP)

coupled to one of the wireless transmitters, configured to sense if one of the fire

extinguishers is moved.

Claim 53 (original): A system for remotely monitoring the status of multiple

fire extinguishers in accordance with claim 51 and further comprising a sensor,

coupled to one of the wireless transmitters, configured to sense fire extinguisher

pressure.

Claim 54 (original): A system for remotely monitoring the status of multiple

fire extinguishers in accordance with claim 51 wherein the wireless transmitters

are defined by respective radio frequency identification devices that each

include a transmitter, a processor coupled to the transmitter, and a battery

coupled to supply power to the transmitter and processor, wherein the receiver is

defined by an interrogator, and wherein the radio frequency identification

devices are configured to selectively identify themselves to the interrogator in

response to an interrogation signal from the interrogator.
